Vysokomol. soyed., 1,7, 951, 1959; Ref. 7: Vysokomol. soyed., 1,7, 957, 1959). These resins are products of the polycondensation of glycols and glycerine with dibasic saturated acids (phthalic or sebacio acid) and monobasic methacrylic acid. The introduction of a monobasic unsaturated acid makes possible regulation of the chain growth in the polyesterification process and thus manufacture of acrylate polyesters with a different degree of polymerization. According to Ya. D. Avrasin and A. I. Prigoreva (Ref. 8: Plast. massy, 1, 13, 1960) properties of glass-reinforced plastics based on acrylate polyesters are caused by the functional force and distance between the unsaturated acrylic end-radicals in the polyester chain. Another common polyester resin is the maleate polyester resin described by P. Z. Li et al. (Ref. 5: Plasticheskiye massy, 2, 19, 1959). A drawback of the manufacture of both types, acrylate and maleate polyesters is evolution of styrene vapors which produce a highly poisoned atmosphere. For this reason in the present work the production of polyester resins not containing volatile poisonous compounds and having good physical and mechanical properties was investigated. Preparation of copolymers of maleate polyesters and low molecular acrylate polyesters with the ability to be solvent and copolymerization component according to a patent of the present authors (Ref. 9: Soviet patent no. 132819,

1960), was selected for this purpose. Maleate-phthalate polyethylene glycol was synthesized and had a higher softening point than the product manufactured by the industry (softening point 45 - 50°C, hard yellow resin, acid number in mgKOH/g of resin - 40-50, viscosity according to VZ -4, of a 50 % solution in styrene at 20°C 4,900 sec.). During polycondensation the temperature was raised gradually up to 200°C and the process was controlled by measuring the acid number and the amount of condensate. The product was dissolved at 70 - 80°C in a mixture of equal parts of dimethacrylate-triethyleneglycol and dimethacrylate (bis-triethyleneglycol) phthalate. This mixture was copolymerized at 20°C by adding an initiator-accelerator system as hardener. For the latter following systems were tested by estimating the gelatination time: isopropylbenzene hydroperoxide - cobalt naphthenate, benzoyl peroxide - dimethylaniline, methylethylketone peroxide - cobalt naphthenate (both imported substances). Optimum results (gelatination time 9 hours) were obtained with the last-mentioned system (2% + 2%). Optimum gelation time (8 hours) with a Soviet hardener was obtained with 3 % isopropylbenzene hydroperoxide + 5 % of a 40 % solution of cobalt naphthenate in styrene. Thus all further tests were carried out using this hardener. It was observed that the hardening ends after 25 days, then the resin has the properties compared in Table 4 and 5 with those of the PN-1 resin. Hardening exotherms (determined by Kh. V. Tsubina) are shown in Figure 3. Using glass gauze Card 3/8

ACTT( $\delta$ )<sub>2</sub> (ASTM (b)S<sub>2</sub>) satin 8/3 with and without removal of the lubricant) with the manufactured MA-3 resin, 5 and 10 mm thick sheets were formed and tested 25 days after preparation. The results are presented in Table 6, showing several advantages in relation to the PN-1 resin and 911-MS binder. Investigations carried out by Yu. A. Agashin, M. M. Tuchenko and P. V. Sidiyakov in the Institut gigiyeny truda i profzabolevaniy (Institute of Industrial Hygiene and Occupational Diseases) demonstrated the advantage of using MA-3 resin instead of PN-1 resin considering sanitary conditions, since the total amount of styrene formed during hardening of PN-1 resin is 12 times greater than for MA-3 resin. There are 4 figures, 6 tables and 9 references: 6 Soviet-bloc and 3 non-Soviet-bloc. The two references to the English-language publications read as follows: Johan Bjorksten. TITLE:

Some properties of anisotropic material reinforced with  
glass fiber

PERIODICAL: Plasticheskiye massy, no. 9, 1962, 39 - 43

TEXT: Glass-reinforced plastics with anisotropic properties, on the basis of glass fiber, diameter 15±2 micron, and ЭД-6 (ED-6) epoxy phenol, ГФ (GF) polyvinyltulyral phenol or ПЭМ-2 (PEM-2) polyamide epoxy resins were tested. The binder content was varied between 18-35% by weight. Results: (1) In all samples a maximum of tensile strength, bending strength and impact strength was found to be associated with a binder content of 20-25%. With 20-25% of ED-6 binder the bending strength was 8800 kg/cm<sup>2</sup>, with 30-35% only 6800 kg/cm<sup>2</sup>. Under equal conditions the values for GF binder were 6200 and 4800 kg/cm<sup>2</sup> respectively. (2) The content of resin fractions soluble in acetone made no difference to the tests, but if the binder contained less than 35% of the soluble fraction

AUTHOR: Nikolayev, A. F.; Levitskaya, O. M.; Brusentsova, L. M.; Katenel'son,  
Ye. Z.TITLE: Some characteristics of an epoxy-phenol binder for SVAM

SOURCE: Plasticheskiye massy\*, no. 5, 1963, 67-68

TOPIC TAGS: SVAM, epoxy-phenol binder, epoxy phenol resin

ABSTRACT: SVAM is prepared from a basic material containing 70% epoxy resin (ED-6) and 30% resol resin; its physico-mechanical properties are dependent on the composition and properties of the epoxy-phenol resin. The resin described here was obtained by combining acetone solutions of ED-6 resin (17-18% epoxy-groups) with a resol phenol-formaldehyde resin (9-10% free phenol) in a ratio of 70:30. It kept well for 60 days, but did not undergo satisfactory hardening even after 30 minutes at 140-200C. An insoluble (non-hardening) portion of 15% or more always remained, lowering the thermostability and rigidity of the material and affecting its physico-mechanical properties. It is suggested that thermosetting might be improved by modifying the composition of the epoxy-phenol resin, matching it with a special resol phenol-formaldehyde resin, and using a catalyst. Orig. art. has: 3 figures.

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 22, 1965, 41-42

TOPIC TAGS: varnish, maleic acid, polyester, styrol, glycerin

ABSTRACT: This Author Certificate presents a method for obtaining varnish coatings based on polyester maleinate resin and styrol. To prevent stickiness of the coating, to increase its durability, and to shorten the hardening time of the varnish, a polyester of saturated two-base acid and allyl ester of glycerin, such as polyallyl glycerin phthalate, are added to the above ingredients.

TITLE: A new oligomeric binder for glass-reinforced flashes

SOURCE: Zhurnal prikladnoy khimii, v. 39, no. 9, 1966, 2035-2038

TOPIC TAGS: glass reinforced plastic, binder, resin MA-3, triethylene glycol dimethacrylate, TGM-3, polyethylene-glycol-maleate-phthalate, MS-1

ABSTRACT: A new binder for glass-reinforced plastics has been prepared from triethylene glycol dimethacrylate (TGM-3) in which the content of the stabilizer — hydroquinone — was decreased to 0.04% instead of the conventional 0.03 to 0.20%, and from polyethylene glycol maleate phthalate (MS-1) resin by heating the components to 80°C and a vigorous stirring. This mixture was prepared in MS-1:TGM-3 ratios of 2:3 and 1:1; the products had viscosities of 50 and 150 centipoises at 20°C respectively, which offers an advantage as compared with the viscosity of 250—430 centipoises of MA-3 resin (specifications: VTU 30-12044-61<sup>b</sup> of the LSNKh<sup>a</sup>) which is used for manufacturing glass-reinforced plastics in the USSR. The mechanical and technological properties of this new binder make possible its use for impregnating glass fabrics and for applying the method of contact molding. The time of gel formation of the new

TITLE: Electrochemical properties of indium-antimony amalgams

SOURCE: Elektrokhimiya, v. 2, no. 1, 1966, 27, 92-96

TOPIC TAGS: semiconductor, InSb semiconductor

ABSTRACT: The results of an experimental investigation of simple In and Sb and compound InSb amalgams by potentiometric and polarographic methods are reported. By using the H. Hartmann et al. potentiometric method (J. Phys. Chem., 1956, v. 9, 106), the behavior of a simple In amalgam was studied at 20, 40, 60, and 80C. Curves of  $\Delta\varphi$  vs.  $\lg c_1/c_2$  for the above amalgams determined from corresponding concentration circuits are presented, and estimated values of the solubility product are tabulated. The solubility of InSb was found to increase with temperature. The linear relation between the wave height and the concentration of metal in the amalgam was discovered in polarographic studies; the solubility product for InSb was found close to its values determined by potentiometric studies. Orig. art. has: 4 figures and 4 tables.

## TITLE:

The effect of low temperatures on electrophysical  
and mechanical properties of epoxide insulation

## PERIODICAL:

Akademiya nauk SSSR. Izvestiya. Sibirskoye otde-  
leniye, no. 7, 1962, 37 - 41

TEXT: Filled epoxide resin was tested at low temperatures with a view to its use as an insulator in high voltage ( $10^6$ V) transmission lines in Siberia. The resin consisted of 100 parts (by weight) of resin ЭД - 6 (Ed - 6), 25 parts polyester no. 1, 30 parts maleic anhydride, 200 parts quartz sand. The samples, in the form of plates, bushings and straight insulators, were tested in the range +20°C to -70°C. On cooling, the value of  $\tan\delta$  of the resin, measured using a P-525 (R-525) bridge at 1kV, fell to a minimum at 0°C and then rose reaching 0.007 at -70°C (the same value as +30°C). The permittivity ( $\epsilon \approx 4$ ) fell slightly but linearly with reduction of temperature. The breakdown voltage ( $U_{br} \approx 35$  kV in a 50 c/s nonuniform field) rose a

S/200/62/000/007/001/002  
D207/D308

little at -70°C compared with room temperature. The electric volume resistivity rose rapidly on cooling. An examination with a microscope showed no irreversible changes on cooling to -70°C followed by return to +20°C. Twenty thermal shock cycles (30 min at -70°C, followed immediately by 30 min at +120°C) hardly altered the electrical properties of the resin. Immersion of the cycled insulators in water showed no cracks. The resistance to arcing under Siberian conditions was also good: no deterioration was found after a year's exposure to intermittent arcing in open air. The ultimate tensile strength of the resin, measured according to ГОСТ 4649-55 (GOST 4649-55), did not vary greatly between +20°C and -70°C. The impact resistance, measured according to ГОСТ 4647-55 (GOST 4647-55), fell from 10.5 kg/cm at +20°C to 8 kg/cm at -60°C; however even the lower value is still better than that of porcelain. There are 7 figures.

## ABSTRACT:

The results of calculating the stress distribution in a circular cylindrical shell stiffened by transverse frames and weakened by a rectangular cutout (see Fig. 1) subjected to torsion, are presented. The design formulas for

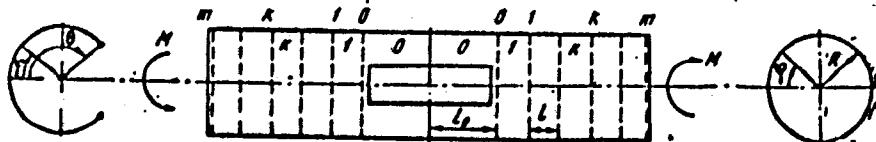

Fig. 1.

Card 1/2

UDC: none

ACC NR: AP7Q02700

such a problem were derived previously by S. I. Galkin (Izv. Sib. Otd. AN SSSR, no. 4, 1960; and Trudy konferentsii po teorii plastin i obolochek, 1961, Kazan'). The distributions of shear, normal, and tangential stresses in the middle portion of the shell (in the neighborhood of the cutout) and in frame-stiffened portions were calculated from these formulas on the M-20 electronic digital computer for 38 versions of the shell structure with geometry and stiffness parameters varying in a wide range, except  $\theta = 135^\circ$  and  $l/R = 0.5$ . The calculation results are plotted in several diagrams, and the dependence of stresses on these parameters is discussed. The effect of rigidity of frames, especially of frames 0, on the state of stress in the shell, mainly on the distribution of shear and tangential stresses along the longitudinal (reinforced) edges of the cutout and around its corners is discussed in detail. The different behavior of these stresses within the open and frame-stiffened portions of the shell caused by the variation in the length of the cutout combined with the variations in the rigidities of frames, as well as the locations of maximum stresses in shells with short and large ( $l_0/R < 1$  and  $l_0/R > 1$ , respectively) cutouts is pointed out. A simultaneous progressive increase of stresses (in both weakened and stiffened portions of the shell) with increasing width of the cutout, irrespective of the frame stiffness is noticed. The effect of stiffeners along the longitudinal edges of the cutout on the stress distribution, and their maximum rational cross-section areas are also examined. The dying-out of stresses (which are caused by the presence of a cutout) in the stiffened portion of the shell, and their practical disappearance at a distance of 2 to  $2.5R$  from the frame 0 is mentioned. TOPIC TAGS: organic phosphorus compound, organic sulfur compound, organic synthetic  
process, phosphorodithioate ester, bactericide, surface active agentABSTRACT: In the search for new surface active organophosphorus compounds with  
bactericide or fungicide properties, pure compounds of the general formula

where  $R = C_{n}H_{2n+1}$  ( $n = 3-10$ ), have been synthesized and studied. The synthesis was carried out by the reaction of phosphorus pentasulfide with alcohols. Pure compounds of this series with 5-10 carbon atoms in a radical R were obtained for the first time and certain of their physical constants were determined. Surface activity (surface tension and foaming capacity) of all synthesized compounds of this series

was also measured. The data showed that O,O-dioctyl hydrogen phosphorodithioate in aqueous emulsion displayed the maximum surface activity (the minimum surface tension). A weak bactericide activity was detected in all synthesized compounds, e. g., a 0.3% aqueous solution of O,O-diheptyl hydrogen phosphorodithioate killed bacteria [JK] coli in ten minutes. Methods for purifying commercial lactic acid and obtaining it in solid preparations. V. V. Levitskaya. *Vestn. Akad. Nauk SSSR*, No. 2, 56-61. Purification of lactic acid (I) by acidifying lactates, by oxidizing impurities, by selective adsorption, by esterification and hydrolysis, or by distillation is never satisfactory in regard to cost, yield, and quality. Controlled distillation is preferred; with 500 cc. of crude I in a 3000-cc. flask the yield is about 75% with the heating bath at 160-170° and a temp. of 100-125° in the crude liquid. The concn. of I in successive fractions is 33-48%. About 8-10% anhydride is formed. The distillates yield a pale or colorless, salt-free condensate (II) contg. 75-90% I, obtained with only 1% loss by passage through a column of activated C and a filter. A fractionator is described and illustrated which yields 93% I. Solid preps. (III) of II for use in soft drinks, confections, and bakery products are made by adding 3-11% of Ca acetate, phosphate, citrate, or carbonate. A preferred method is to heat 90 parts (by wt.) of 80% I with Ca acetate 8.8, Ca lactate 11.8, or  $\text{CaCO}_3$  8 parts for 10 min. at 80°. The paste thus prep'd. from conc. I contains 12% ash, or from pure I 4% ash. Hygroscopicity was tested in terms of wt. gain of caramel pastes after 15 days in air at 65% relative humidity. Moisture absorption data (in %) for different concns. of acid in the caramel were: 1% citric, 2.8; 1% I, 2.85; 1.2% III, 3.0; 1.2% I, 2.9; 1.5% III, 3.15%.

ABSTRACT: An Author Certificate has been issued for a machine for cutting joints in hardened road paving. It consists of a double-disk operating organ mounted on a wheeled frame, a device for cooling the disks, and a drive. To increase maneuverability and assure the disk's precise positioning in the seam, an extensible rotating support is mounted in the center of the wheeled frame; the support's axis of rotation is located in the cutting disk's plane of rotation. In order to automatically compensate for disk wear while cutting seams, the cutting disks can be mounted on vibrating levers through actuating cylinders connected to the machine's frame and joined with a guide device. TITLE: All-Union Conference on the Utilization and Neutralization of Sewage Waters Used on Irrigated Fields. (Vsesoyuznoye soveshchaniye po ispol'zovaniyu i obezvrezhivaniyu stochnykh vod na zemledel'cheskikh polyakh orosheniya)

PERIODICAL: Gidrotekhnika i Melioratsiya, 1958, # 3, pp 62 - 64 (USSR)

ABSTRACT: The All-Union Conference on the Utilization and Neutralization of Sewage Waters on Irrigated Fields took place in Moscow from 7 to 11 January 1958. The conference was called by the Ministerstvo sel'skogo khozyaystva SSSR (Ministry of Agriculture of the USSR) together with the Nauchno-tehnicheskoye obshchestvo sel'skogo i lesnogo khozyaystva (Scientific-Technical Society of Agriculture and Silviculture), Vserossiskoye nauchnoye obshchestvo gigiyenistov (All-Russian Scientific Society of Hygienists), and Nauchno-tehnicheskoye obshchestvo gorodskogo khozyaystva i sanitarnoy tekhniki (Scientific-Technical Society of Municipal Administration and Sanitary Technics). A specially formed organizational Committee under the chairmanship of A.M. Levitskiy received 50 reports on

Card 1/3

99-58-3-12/12

All-Union Conference on the Utilization and Neutralization of Sewage Waters  
Used on Irrigated Fields

matters connected with the subject of the conference. These reports were printed and sent to all 328 members participating at the conference. A.M. Levitskiy read a paper on the importance of the use of sewage waters and on ways of further developing irrigation fields. Three more reports were read by: 1) I.P. Kanardov, Candidate of Agricultural Sciences, on "The Methods of Utilizing Sewage Waters in Kolkhozes and Sovkhozes of Urban Areas"; 2) Candidate of Technical Sciences, L.G. Demidov, on "The Experiences in Projecting Irrigated Fields", and 3) P.N. Matveyev, Candidate of Medical Sciences, on "Some Results and Prospects of Hygienical Studies on Questions of Neutralizing and Utilizing Sewage Waters of Kolkhozes and Sovkhozes". The foremost hygienists of the USSR - Professors S.N. Cherkinskiy (Moscow), R.A. Babayants (Leningrad) and V.M. Zhabotinskiy warned the conference, that extensive development of such irrigated fields are possible only under the conditions of a harmonious coordination of the interests of all economic branches. Several members of the conference criticized the passive attitude of numerous organizations as pertaining to this question,

Card 2/3

99-58-3-12/12

All-Union Conference on the Utilization and Neutralization of Sewage Waters  
Used on Irrigated Fields

and the absence of a head organization, which could take care of the financial part of this question. Professor I. Bauman (Humboldt University, Berlin, German Democratic Republic) acquainted the conference with work conducted in Germany on this subject. Sewage water, after mechanical purification, is widely used in Germany and does not cause bacterial contamination. The conference finally recommended that the executive committees of the Moscow, Leningrad, Kiyev, Khar'kov, Odessa and Kaliningrad Oblast's from now on prepare for an extensive projecting of sewage irrigation. It was also decided to ask the USSR Ministry of Agriculture to establish a special department in the Ministry which will deal exclusively with this matter.

"Expediency of Utilization of Blind Shafts and Selection of the Location of Their Foundation," A. V. Levitskiy, Candidate Technical Sciences, 5 pp

"Gornyy Zhurnal" Vol CXXI, No 6

The main object of opening up blind shafts is to increase the length of crosscuts for development of the lower levels by vertical shafts. Also expedient from the standpoint of guaranteeing simultaneous preparation of levels.
